

Java Interface Practice Questions

- 1. Create two interfaces Printer and Scanner. Printer should contain method void print(); and Scanner should contain method void scan();. Create a class Machine that implements both interfaces and call both methods from the main method.
- 2. Create an interface Shape with method void area();. Create two classes Circle and Square that implement Shape. Circle should calculate the area using radius = 5 and Square should calculate the area using side = 4. Use an interface reference variable in the main method to call both implementations.
- 3. Create an interface Vehicle that contains an abstract method void start(); and a default method fuel() that prints "Petrol". Create a class Car that implements Vehicle and override the start() method. Call both methods from the main method.
- 4. Create two interfaces A and B. Both interfaces should contain the same default method show(). Create a class C that implements both interfaces and resolve the method conflict by overriding show(). Call both interface methods from inside the overridden method.
- 5. Create an interface Device with a variable VERSION, an abstract method start(), a default method info(), and a static method company(). Create another interface SmartFeatures with method connectWifi() and a default method info(). Create a class SmartTv that implements both interfaces. Resolve the default method conflict of info() and call all relevant methods from the main method.
